

Dynamo database

- Amazon DynamoDB is a fully managed, serverless NoSQL database service provided by amazon web services (AWS).
- It's designed to handle high-traffic applications that need low-latency responses and scalable storage, making it ideal for real-time applications.
- DynamoDB supports key-value and document data models, allowing developers to build applications with flexibility and speed.

Key Features of DynamoDB:

Serverless: AWS manages all the infrastructure, so there's no need for users to worry about hardware provisioning, setup, and maintenance.

Scalability: DynamoDB automatically scales up or down in response to traffic changes, allowing applications to handle millions of requests per second seamlessly.

High Availability: It offers a distributed architecture that ensures high availability and durability by replicating data across multiple AWS regions.

Low Latency: DynamoDB is optimized for high-speed performance, with typical response times in single-digit milliseconds.

Flexible Data Models:

- **Key-Value Store:** Data is stored as key-value pairs, useful for simple queries.
- **Document Store:** DynamoDB can store semi-structured data in the form of JSON documents, making it adaptable to complex data relationships.
